# **Condor Sigma W12**

### **Condor** Sigma W12

*Fully integrated solution for automated wafer testing (up to 300 mm)* 

Technology leader in bond testing worldwide

Customized wafer chuck with quick clamp position for calibration jigs

Six sensors RMU: Changing cartridges manually no longer required

Fully integrated calibration solution for multiple ranges

fastest wafer bump tester available

High resolution camera system: Mitutoyo optics

#### Performance and flexibility

The Condor *Sigma W12* is the most advanced bond tester on the market, combining the unique strengths of the Condor series with the latest technologies and innovations. Whenever you need a bond tester for testing wafers you can choose between a fully integrated solution with wafer loader or a stand-alone tester. For your specific application we can offer multiple types of customized wafer chucks.

**Revolving Measurement Unit** 

XYZTEC is well known for many innovative bond testing solutions. The Revolving Measurement Unit (RMU) being a good example that was derived from a better understanding of our

customers' needs. The *Sigma* RMU sets new standards with its capability of up to six pull- or shear sensors with different tooling always ready for immediate use. Sensors are permanently and safely fixed to the machine, require no warm up time and easily selected by the simple click of button.

#### Soft landing and high resolution

The Condor *Sigma W12* can perform a wide variety of tests with forces ranging from less than 0.1gf to 10kgf. Intelligent software enables extremely rapid movements and automatically slows down as the test area is approached. Large stage travel distances come as standard and rapid power up is guaranteed with multiple home positions. Shear sensors have the most precise step back accuracy in the industry and programmable landing forces.

#### Built-in image capture and automation camera

For automation, pattern recognition and image capture the standard configuration contains a perpendicular camera rigidly fixed close to the test point. There are multiple magnifications to choose from including an optical resolution of 1.5µm. The Condor *Sigma W12* can also include a high resolution camera system with Mitutoyo optics that guarantees the very best image quality and detail. Vision processing comes complete with fully programmable algorithms including big bump recognition.

## Chosen by the world's top 4 semiconductor packaging houses Fully integrated $% \mathcal{F}_{\mathrm{S}}$

#### Wafer handlers

Together with the market leaders of wafer handling equipment we offer a fully integrated and automated solution. Leading edge products for up to 300 mm equipment frontend

300 mm equipment frontend module (EFEM) platforms.

High precision, fully automated, low vibration, maximum throughput and extensive safety features.

Automatic wafer size detection, PID controlled centered lift pins with guaranteed secure wafer loading and un-loading.

#### Sideview camera

Using a conventional microscope tool alignment from left to right can easily be judged but front to back is more difficult. The addition of a side view camera ensures the tool can be perfectly aligned in all directions.

#### **Big bump removal**

To prepare for wafer probing, big bumps need to be removed by shearing them off and cleaning any debris. Fully programmable vision algorithms are used to check if big bumps are successfully removed.

Side view camera, directly mounted on the frame

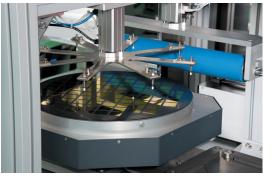

#### Wafer pusher

In most cases the high air flow of XYZTEC vacuum chucks easily pulls down warped wafers. In cases of extreme warpage an optional wafer pusher ensures precise clamping.

#### Wafer chuck cleaner

To make sure no debris is on the wafer or on the chuck a special cleaner is offered to perform fully automated pre- and post test cleaning.

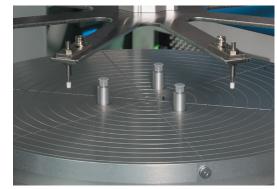

Wafer pusher besides the wafer loading arm

#### **Intelligent lift pins**

PID controlled wafer lift pins come equipped with soft flexible tips that gently secure flat and warped wafers. Vacuum sensing and switching is intelligently timed with the lift pin position throughout the load, clamp and unload cycle.

#### Wafer alignment

Advanced optical sensors guarantee precise wafer loading and alignment.

Fully extended centered wafer pins with vacuum tips

#### **CBP Jaw Cleaner**

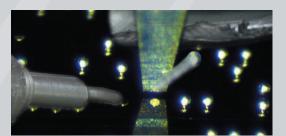

During use solder builds up in the cavity of cold bump pull (CBP) jaws. This reduces their grip efficiency and affects the quality of your measurements. The patented CBP Jaw Cleaner with a high temperature and high pressure air jet quickly melts the solder and then blows it away after each test.

#### **Reliable debris removal**

Test debris is reliably captured by a rigid and optimally positioned automatic wafer cleaning solution. Sheared balls are removed quickly by a combination of an air jet and vacuum pickup.

#### Import/export of wafer map files

The Condor *Sigma* software offers import- and export of multiple file formats for wafer maps (KLARF, INF, etc.). After the import the map shows a complete overview. The system will guide you step by step through all marked defects.

The tested positions are clearly marked on the map. When all tests are finished, the wafer map and test results can be exported for full traceability. For each die a high resolution picture can be made that shows and marks the tested bumps. An offline viewer is available to check the exported wafer map files and the test results.

#### Auto focus and SPC

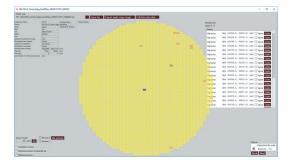

The XYZTEC Condor *Sigma* series also offers extensive software for bond testing with full statistical process control (SPC), automation and vision. Camera systems can be used to generate pictures for all tests, failed tests or specific measurements.

Quick auto focus guarantees optimal picture sharpness. Pictures and/or the live camera images can be used by the operator when grading.

**Complete automation** 

The Condor *Sigma* software offers the most capable automation in the market. Powerful vision software can find fiducial marks, defects (big bumps), solder balls, pillars together with the automatic grading of shear tests. Automation can also be fully integrated with the wafer loader for operator free testing.
